PROFESSIONAL SUMMARY

Backend Engineer with 3+ years shipping production systems at real scale — a healthcare SaaS serving 1,500+ organizations and 10,000+ doctors, and an AI media platform trusted by Netflix, Warner Bros., and Pinewood Studios. Core expertise spans backend development (Node.js, Ruby on Rails), database design (MySQL, MongoDB), and DevOps (Docker, Jenkins, CI/CD). Currently contributing to two live products simultaneously across different stacks and problem domains. Open to remote Backend, DevOps, and Full-Stack roles.

TECHNICAL SKILLS

Languages & Frameworks: Node.js, JavaScript, Ruby on Rails, Python, Express.js, Hapi.js
Databases: MySQL, MongoDB, Redis — indexing, aggregation pipelines, query optimization, caching
DevOps & Cloud: Docker, Jenkins, CI/CD, AWS (EC2, Lambda, SQS, SNS), GCP, Azure, Nginx, Capistrano, DigitalOcean
Backend & Data: REST APIs, ETL Pipelines, Data Modeling, Full-text Search, Webhook Processing, AI/ML Integrations
Testing & Tools: RSpec, Mocha, Jest, Swagger, Git, GitHub, Bitbucket
Frontend: ERB/Rails admin UIs (production), React.js (personal projects)

WORK EXPERIENCE

Backend & AI/ML Engineer, *StorageDNA — via Bigscal Technologies (Contract)* **Apr 2024 – Present**
Remote, USA · 5–10 person engineering team

- Part of a small team building DNAFabric, an AI-powered media asset management platform serving enterprise clients including Netflix, Warner Bros., and Pinewood Studios.
- Implemented batch and event-driven ETL pipelines (Node.js + Python) to extract and enrich media file metadata using AI services across AWS Rekognition, Azure Cognitive Services, GCP Vision, and specialist providers — covering transcription, label detection, celebrity recognition, face analysis, content moderation, and classification.
- Architected MongoDB data models, compound indexes, and aggregation pipelines as the primary database layer, enabling fast full-text and structured querying across large enriched media catalogs.
- Developed a multi-vendor AI aggregation feature normalizing outputs from disparate providers into a unified MongoDB schema, eliminating data silos and enabling consistent cross-vendor querying.
- Delivered a flexible export system supporting searchable AI insight browsing, full transcript exports, and custom-filtered record exports — all from one pipeline; contributed ~50 REST API endpoints.

Software Developer, *Bigscal Technologies Pvt. Ltd.* **Jan 2023 – Present**
Surat, India · Joined at ~50 engineers, now 150+ · Primary project: Healthray — Multi-Tenant Healthcare SaaS (Node.js, MySQL, Redis, MongoDB, Ruby on Rails, Docker, Jenkins)

- Shipped 100+ REST API endpoints across three Node.js modules (EMR, Laboratory, Admin Panel) for a platform serving 1,500+ healthcare organizations, 10,000+ doctors, and thousands of pharmacy and lab staff.
- Designed a subscription-tiered, resource-level, multi-tenant RBAC system for the EMR module — permissions gated by subscription plan, scoped by role-level resource controls, with strict cross-tenant data isolation across thousands of independent organizations.
- Integrated Razorpay payment processing for the Lab module: subscription plan management, async webhook handling for payment lifecycle events, and automated invoice/receipt generation — eliminating a fully manual billing workflow.
- Automated WhatsApp patient campaign delivery via Vartalaap — offloading the entire Meta template approval and management process to the provider, reducing campaign setup from a multi-day manual workflow to a same-day self-service process, cutting setup effort by 70%+.
- Resolved a systemic encryption inconsistency across high-frequency MySQL fields, eliminating a data layer security risk affecting sensitive patient records.
- Reduced query execution time from 16–17 seconds down to 1–2 seconds on high-load endpoints by introducing composite indexes and precomputed MySQL views — replacing full-table scans on a large unified user table with a self-inheritance architecture.
- Rebuilt Docker infrastructure using Alpine base images and multi-stage builds to drastically reduce image sizes; isolated each module into dedicated Docker bridge networks, eliminating Redis cache pollution and job queue interference that had been causing cross-module data integrity issues.
- Set up Jenkins CI/CD pipelines per module with distinct staging and production environments, making deployments independent and predictable across all three services.
- Maintained the ERB-based Rails admin panel covering org onboarding, feature flag management, subscription billing, campaign monitoring, and shared reference data (medicine directories, disease catalogs, medical specialties).

NOTABLE PROJECTS

Healthray — Dynamic RBAC with Real-Time Permission Updates | *Node.js · MySQL · Redis* 2023 – Present

- Challenge: admins create and modify roles dynamically at runtime, making static permission caching at login unviable.
- Implemented real-time permission resolution evaluating access on every request against live role state; used Redis to absorb the performance overhead under concurrent admin changes.
- System resolves three layers per request: subscription plan (feature gates), role-level resource permissions (action scope), and strict multi-tenant data isolation — no restarts or manual cache invalidation required.

DNAFabric — Metadata Enrichment & Cross-Platform Insight Linking | *Node.js · Python · MongoDB · AWS · Azure · GCP* 2024 – Present

- Core challenge was transformation, not extraction — normalized AI outputs from AWS Rekognition, Azure, GCP, and specialist providers into a unified MongoDB schema supporting full-text search and structured filtering without per-vendor indexes.
- Developed cross-project insight linking: AI insights from the same media file analyzed across different platforms are aggregated into a single access point, eliminating fragmented per-project lookups.

Healthray — Multi-Module CI/CD on Shared Infrastructure | *Docker · Jenkins · docker-compose · Linux*2023 – Present

- Problem: multiple Node.js modules on one server caused Redis cache pollution, job queue interference, and bloated Ubuntu 20 build images.
- Switched to Alpine base images with multi-stage builds; assigned each module a dedicated Docker bridge network to isolate Redis instances and queue workers.
- Eliminated cross-module data integrity issues, significantly reduced image sizes, and made per-module Jenkins deployments independent and predictable.

Side Projects | *AWS · React.js · Ruby on Rails · Docker*

- Serverless media extraction pipeline on AWS (Lambda, SQS, EC2, SNS) with real-time alerting. Personal portfolio in React.js on Vercel. Real-time chat app with Rails Turbo Streams for pub/sub practice.

EDUCATION

B.Tech, Computer Engineering, *Gujarat Technological University (GTU)* **2019 – 2023**
GPA: 9.0 / 10
