PROFILE

Backend and AI platform engineer with 3 years 4 months of professional experience building production systems at real scale. At StorageDNA: designed and owned the multi-provider AI ingestion layer across ~18 cloud and AI providers coordinated by a ~3,000 LOC Python orchestrator, feeding a unified MongoDB schema for petabyte-class media catalogs at Netflix and Warner Bros. - the AI integration feature that won StorageDNA the **IBC 2025 award in Amsterdam**; the surrounding v2 API and Claude MCP layer (400+ endpoints) were showcased at **NAB 2026 (Las Vegas)** and **MPTS 2026 (London)**. At Healthray: owned the admin panel, multi-tenant RBAC, laboratory module, Docker infrastructure, Jenkins CI/CD, and payment integrations (Razorpay) for a SaaS platform serving 1,500+ healthcare organizations and 10,000+ doctors - platform showcased at the **Global Digital Health Summit, Jio World Convention Centre, Mumbai**. Author of Daedalus, an open-source multi-agent LLM orchestration system with plan-execute-evaluate loops, per-agent circuit breakers across 6 AI providers, and 137 tests. Available immediately.

CORE COMPETENCIES

Node.js / TypeScript / Python

Ruby on Rails

REST API Design

Multi-Agent LLM Orchestration

LangGraph / ReAct Loops

Multi-Provider AI Integration

ETL & Data Pipelines

MongoDB / Redis / MySQL

PostgreSQL

AWS (EC2 · Lambda · SQS · SNS)

Docker / Jenkins CI/CD

Multi-Tenant RBAC

Webhook & Event-Driven Systems

Payment Integration (Razorpay)

Petabyte-Scale Normalization

WORK EXPERIENCE

StorageDNA via Bigscal Technologies (Contract)

Apr 2024 - Apr 2026

Backend & Data Platform Engineer · Remote, USA · Enterprise media asset management · Clients: Netflix, Warner Bros., Pinewood Studios

- Multi-provider AI ingestion:** Shipped production ingestion across ~18 cloud and AI providers - audio AI (AssemblyAI, Whisper, Trint), video AI (TwelveLabs, MomentsLab, Tessact, Azure Video Indexer, Google Media), vision AI (Azure, Google, AWS Rekognition), cloud storage (Box, Dropbox, S3, Google Drive), media platforms (Frame.io v2/v4, Iconik, OvercastHQ) - coordinated by a ~3,000 LOC Python orchestrator handling retries, scheduling, and run state. The unified AI integration layer was the basis for StorageDNA's **IBC 2025 award win in Amsterdam**.
- Schema normalization:** Built 8 provider-specific normalizers feeding a unified MongoDB schema with a conflict resolution and validation pass on parallel-provider outputs before commit - schema held stable across two years of provider drift; each new provider = one-file adapter change.
- v2 API + Claude MCP:** Rewrote 400+ REST API endpoints for dual use: client self-service and machine-readable LLM-agent consumption via an internal Claude MCP server with error semantics designed for programmatic agent recovery. Showcased at **NAB 2026 (Las Vegas)** and **MPTS 2026 (London)**.
- Live analytics:** Replaced a legacy Java Lucene-based catalog indexer with a Node.js job-queue ingestion engine - converted multi-hour batch reporting into live workflow analytics queryable on demand.
- Provider cost calculator:** Cron-driven monthly cost ingestion joining 15+ default providers with client-added custom providers; replaced a manual Tableau-driven analyst workflow with a fully composable Node.js service.
- Petabyte-scale ETL:** Batch and event-driven pipelines for media metadata enrichment (transcription, label detection, content moderation, celebrity recognition); MongoDB compound indexes and aggregation pipelines for fast full-text and structured querying.

Software Developer · Surat, India · Joined ~50 engineers, grew to 150+

- **Healthcare SaaS at scale:** Owned end-to-end the admin panel, multi-tenant RBAC, laboratory module, Docker infrastructure, Jenkins CI/CD, and database for Healthray - 1,500+ healthcare organizations, 10,000+ doctors; showcased at the **Global Digital Health Summit, Jio World Convention Centre, Mumbai**.
- **API delivery:** Built and maintained 150+ REST API endpoints across three Node.js modules (EMR, Laboratory, Admin Panel) for concurrent use by web, mobile, and partner integrations.
- **Real-time RBAC:** Designed a subscription-tiered, resource-level, multi-tenant RBAC system resolving three layers per request (subscription plan, role scope, cross-tenant isolation) against live role state with Redis; no restarts or manual cache invalidation required.
- **Query performance:** Reduced endpoint latency from 16-17 seconds to 1-2 seconds using composite indexes and precomputed MySQL views, replacing full-table scans on a self-inheritance user table architecture.
- **Infrastructure:** Rebuilt Docker with Alpine base images, multi-stage builds, isolated bridge networks per module; set up per-module Jenkins CI/CD with independent staging and production environments.
- **Payment integration:** Integrated Razorpay - subscription management, async webhook lifecycle for all payment events, automated invoice/receipt generation; eliminated a fully manual billing workflow for 1,500+ organizations.
- **Security & automation:** Resolved a systemic encryption inconsistency across high-frequency MySQL fields in sensitive patient records; automated WhatsApp patient campaign delivery via Vartalaap (70% effort reduction).

NOTABLE PROJECTS

Daedalus - Multi-Agent LLM Orchestration System Open Source

Python · LangGraph · MongoDB (Motor) · Redis (Upstash) · OpenRouter · Groq · Cerebras · Scaleway · Ollama | Mar 2026 - Present | github.com/darshan2101/Daedalus

Each agent runs a plan-execute-evaluate loop targeting >0.88 component-level scores; parallel agent outputs go through conflict resolution before checkpoint commit to MongoDB, making outputs deterministic enough to test against. Per-agent model assignment across 6 providers with circuit breakers backed by Upstash Redis health tracking - unhealthy providers are isolated per agent role, not globally, preventing thundering-herd on rate-limit events. Async topological wave execution on LangGraph: each wave runs concurrently, the next wave starts only when its dependencies resolve. 137 unit and integration tests across ~20 source files.

DNAFabric - Multi-Provider AI Ingestion, Normalization & v2 API Platform IBC 2025 Award · NAB 2026 · MPTS 2026

Node.js · Python · MongoDB · AWS · Azure · GCP · AssemblyAI · Whisper · TwelveLabs · MomentsLab · Frame.io · Iconik | 2024 - 2026

Normalized AI outputs from ~18 providers (audio, video, vision, cloud storage) into a unified MongoDB schema without per-vendor indexes, via a ~3,000 LOC Python orchestrator. Built 8 provider-specific normalizers with conflict resolution and a validation pass before schema commit. Rewrote 400+ REST API v2 endpoints for dual use: client self-service and LLM-agent consumption via Claude MCP. Replaced a legacy Java Lucene indexer with a Node.js job-queue engine converting batch reporting into live analytics. **IBC 2025 award winner (Amsterdam)**; showcased at **NAB 2026** and **MPTS 2026**.

Healthray - Real-Time RBAC, Performance & Infrastructure

Node.js · MySQL · Redis · Docker · Jenkins | 2023 - 2026

Three-layer per-request RBAC resolution (subscription plan, role scope, tenant isolation) against live role state using Redis - no restarts or cache invalidation required. Reduced critical query time 16-17s → 1-2s with composite indexes and precomputed MySQL views. Rebuilt Docker infrastructure with Alpine images, multi-stage builds, and per-module isolated bridge networks eliminating cross-module data integrity issues.

Serverless Media Pipeline - AWS Lambda + SQS + SNS

AWS Lambda · SQS · SNS · EC2 | Side project

Event-driven serverless media extraction pipeline with real-time alerting: SQS-triggered Lambda processing, SNS notifications, EC2 for stateful compute.

TECHNICAL SKILLS

Languages & Frameworks: Node.js, JavaScript, TypeScript, Python, Ruby on Rails, Express.js, Hapi.js, React.js

AI & LLM: Multi-agent orchestration (LangGraph), plan-execute-evaluate loops, per-agent circuit breakers, eval frameworks, multi-vendor AI abstraction (Groq, OpenRouter, Cerebras, AWS Rekognition, Azure Cognitive Services, GCP Vision, AssemblyAI, TwelveLabs, Whisper, Trint)

Databases: MongoDB (aggregation pipelines, compound indexes, Motor async), Redis (caching, pub/sub, health tracking), MySQL (composite indexes, precomputed views), PostgreSQL

Cloud & Infrastructure: AWS (EC2, Lambda, SQS, SNS), GCP, Azure, Docker (Alpine, multi-stage, bridge networks), Jenkins CI/CD, Nginx, DigitalOcean, Capistrano

Backend & Data: REST API design, ETL pipelines, job queues & workers, webhook & event-driven architecture, petabyte-scale normalization, full-text search, multi-tenant systems, payment integrations

Testing & Docs: Jest, Mocha, RSpec, 137-test suite (Daedalus), Swagger, API documentation

EDUCATION

B.Tech, Computer Engineering · [Gujarat Technological University \(GTU\)](#)

2019 - 2023

GPA: 9.0 / 10
